Global Warming Data, Trend and Projection
Dr. Rich Ferguson, CEERT
Updated August, 2017

**Update Note** – Global temperatures in July 2017 were slightly cooler than the trend, but the month was still the 2\textsuperscript{nd} warmest June on record behind only July 2016.

**Data** – Monthly global surface temperature anomaly data (red and blue lines) are monthly differences from the average temperature for that month during the years 1901-2000 and are available from NOAA. The red (blue) lines represent monthly temperatures warmer (cooler) than the trend. Note that 0.2 °C has been added to the NOAA values to account for the difference between the 20\textsuperscript{th} century average and pre-industrial values.

**Trend and Projection** — The trend shown in the chart is a quadratic fit to the recorded monthly global temperatures since 1960 relative to pre-industrial values. The projection is the continuation of this curve into future times. Note that the projection will change as the historical trend changes in response to new data. Recent temperatures are more than half the 2.0 °C target limit established by the Paris agreement. Based on the current projection, global temperatures will be 1.5 °C above pre-industrial levels by 2035 and the Paris Agreement’s +2.0 °C target limit would be surpassed in 2051 (see chart.)
